

FINsight – TECHNICAL OVERVIEW

Capstone technical summary derived from the submitted source repository

Component	Implementation / Observation
Application	Python/Flask web application packaged for Windows; local-first deployment.
Database	SQLite with SQLAlchemy ORM/data access.
Input	CSV/XLSX uploads with structure detection, mapping and validation.
Review Engines	Dedicated Accounting, Audit and Tax review services and rule modules.
Unified Review	Readiness gate, orchestration, finding normalization and Findings Centre.
Risk	Configurable risk cut-offs with low/medium/high/critical bands.
Storage	Engagement-scoped local input/processed/output folders plus SQLite.
Security	Upload hardening, path traversal protection, engagement isolation, secure session configuration and o
LAN	Optional trusted-network mode using Waitress; LAN feature disabled by default.
AI	AI provider integration is not currently wired to the live application; AI flag is OFF by default.
Testing	44 named test files are present in the source tree.
Rules	44 dedicated Accounting/Audit/Tax rule modules were found in the submitted source tree.

Key design principle: the UI should call backend functions, the backend communicates with the database through modular functions, and business rules remain separated from presentation logic as far as the single-application architecture permits.
