

FINsight – USER MANUAL

AI-Powered Financial & Tax Analysis Tool

CA Shivangi Mehta | AICA Level 2 – Batch 83 (Surat)

1. Before You Start

- Use a Windows computer for the packaged application.
- Keep the FINSight application folder intact; do not move individual files inside it.
- For demonstration, use the supplied sample financial files.

2. Start FINSight

- For local use, start the supplied local launcher or the packaged Windows application.
- The application opens in a web browser on the local computer.
- Keep the launcher window open while the application is running.

3. Create / Select an Engagement

- Use the engagement area to create or select the engagement being reviewed.
- Keep each client/engagement logically separated so findings and uploaded files remain associated with the correct engagement.

4. Upload Financial Data

- Upload supported CSV/XLSX financial files.
- Typical inputs include trial balance, general ledger, purchase register, sales register and fixed-asset register.
- Review upload status and validation messages before proceeding.

5. Map and Validate

- Use structure detection and mapping to align source columns with the application's expected fields.
- Resolve validation issues before running the unified review.
- The unified review workflow uses a readiness gate so incomplete uploads do not silently enter the full review.

6. Run Reviews

- Run the applicable Accounting, Audit and Tax reviews.
- The unified review workflow can orchestrate the three review areas.
- Review the summary and then open individual findings for detail.

7. Review Findings

- Use the Findings Centre to view normalized findings across modules.
- Treat every finding as a professional review item rather than an automatic conclusion.
- Document the conclusion, evidence and action taken in the appropriate working-paper/query workflow.

8. Risk and Queries

- Use risk information to prioritize review attention.
- Use query/working-paper functionality to record questions, evidence and follow-up actions.

9. Reports / Outputs

- Use the application's report/output facilities where available.
- Retain exported outputs together with the engagement documentation according to your professional record-retention process.

10. Local / LAN Mode

- Local mode is intended for the host computer only.
- Private-LAN mode is intended only for a trusted office/home network; do not expose the application directly to the public internet.
- In LAN mode, data remains on the host computer.

11. Backup

- Back up the local database and data folders before moving or upgrading the application.
- Keep backups in a secure location appropriate to client confidentiality requirements.

12. Troubleshooting

- If the application does not start, review the launcher output and the logs folder.
- If LAN access fails, confirm that the computers are on the same trusted network and that the firewall permits the configured application port.
- Do not disable antivirus protection simply to bypass a warning; verify the build first.

Professional-use note: FINsight is a review aid. Final accounting, audit and tax conclusions remain the responsibility of the qualified professional.
