

AUDITVAULT

Presentation and Live Demonstration Script

A role-based internal audit engagement and working-paper management system

Recommended presentation length: 10-12 minutes

Presenter edition

Includes the speaking script, role descriptions, live-demo sequence, controlled deletion workflow, sample scenario, security explanation, and demonstration credentials.

Recommended presentation length: 10-12 minutes

1. Opening - about 45 seconds

Good morning/afternoon. Today I am presenting AuditVault, an internal audit engagement and working-paper management application. Audit teams often depend on folders, spreadsheets, emails, and manually named file versions. That creates risks such as missing evidence, unclear ownership, duplicate versions, weak review tracking, and limited management visibility. AuditVault brings this lifecycle into one secure, role-based workspace.

The application is built with Python, Streamlit, SQLite, SQLAlchemy, and local version-controlled file storage. It supports Indian date and currency formats and can later migrate to PostgreSQL.

2. Main value proposition - about 45 seconds

AuditVault manages an audit from engagement creation through final archival. It connects clients, engagement letters, teams, RCMs, evidence, observations, review comments, completion controls, controlled deletion, and an immutable audit trail. Its key principle is: every engagement, every version, securely vaulted.

3. Explain the user roles - about 2 minutes

There are three user roles.

Admin: The Admin creates Managers or Team Members, resets passwords, deletes Manager accounts, reviews the audit trail, and uses logged support impersonation. The Admin is separated from audit execution.

Manager: The Manager creates clients and engagements, defines scope and dates, uploads the engagement letter and RCM, forms audit squads, assigns auditors, reviews work, completes audits, and may reopen them. Managers may create or delete Team Members, but only an Admin can create or delete a Manager.

Team Member: The auditor sees assigned engagements only, uploads evidence, records observations, responds to review comments, and views version history. Locked engagements become read-only.

4. Live demonstration flow - about 6 minutes

Admin demonstration

- Sign in with the Admin account.
- Open Team Management and show that Admin can register a Manager or Team Member.
- Show Reset Password and the Delete Account tab. Explain that Admin can delete Manager accounts.
- Open Audit Trail and show both the complete ledger and Access Control & RBAC Accountability ledger.
- Point out role/category filters, previous and new state, SHA-256 chain verification, event JSON, and compliance CSV export.
- Show Switch User and explain that impersonation start and end events are logged.

Say: This demonstrates segregation of duties, administrative accountability, and evidence integrity.

Manager demonstration

- Sign out and sign in as rohit.sharma.
- Show dashboard cards, charts, statuses, deadlines, and Indian currency formatting.
- Open Clients and explain the centralized client master.
- Open Team Management, edit a squad, and add or remove a member.
- Open Engagements and select Sundaram Textiles Ltd.; explain the code, process, period, fee, and status.
- Download the RCM Excel template, import the sample RCM, and open an RCM line-item workspace.
- Show evidence upload, observations, comments, review status, and date-versioned file history.
- Explain that Complete Audit consolidates the newest evidence versions into a ZIP and locks the engagement.
- Open the controlled deletion panels. Show exact User ID, engagement code, or client-name confirmation. Explain the separate choice for deleting local evidence/base files.

Say: Deleted accounts lose access, while historical comments, upload attribution, and audit evidence remain available for accountability.

Auditor demonstration

- Sign out and sign in as anita.kulkarni.
- Show that only assigned engagements are visible.
- Open a line item, upload sample evidence, enter an observation, and respond to a query.
- Explain the folder pattern: engagement, client, line item, and date.
- Explain that each dated folder preserves earlier evidence versions instead of overwriting them.

Say: This gives the engagement team a clear working-paper trail while preserving Manager control.

Profile demonstration

- Open My Profile, upload a PNG or JPEG photo, update the profile, and show the avatar in the top bar.
- Briefly show the light and dark theme options.

5. Sample business scenario

For the demonstration, our client is Sundaram Textiles Ltd. The engagement code is ENG-2026-014, the process is Procure-to-Pay, and the estimated fee is INR 14,50,000. We import the approved RCM, test whether purchase orders, goods-received notes, and invoices agree, upload a sample workbook as evidence, record exceptions, and submit the work for Manager review.

Suggested observation

During sample testing, 3 of 25 invoices did not contain evidence of independent three-way-match review before payment. This may increase the risk of duplicate or unsupported payments. We recommend a mandatory approval control and monthly exception monitoring.

Suggested review query

Please confirm whether the three exceptions were approved retrospectively and attach the supporting approval evidence.

Suggested auditor reply

Management provided approvals for two exceptions. One item remains unsupported and has been retained in the final observation.

6. Security and technical explanation - about 1 minute

Passwords are stored as salted hashes rather than plain text. Access is filtered by role and assignment. User actions are logged in an append-only SHA-256 hash chain. Evidence is stored in a structured folder hierarchy, and completion creates a consolidated archive. The demonstration account can activate on only one computer through local device binding. File deletion is restricted to the AuditVault data directory and requires explicit confirmation.

For production use, I would place the app behind HTTPS, use PostgreSQL, centralized identity management, encrypted object storage, server-side session controls, regular backups, and independent security testing.

7. Closing - about 30 seconds

AuditVault reduces administrative effort, improves traceability, and gives Managers real-time visibility without removing professional audit judgment. It demonstrates how a fragmented audit process can become a controlled, searchable, and reviewable digital workflow. Thank you; I am happy to demonstrate any role or workflow in more detail.

Presentation safety notes

- Use only sample evidence and fictional information during the presentation.
- Do not select permanent local-file deletion unless you are demonstrating on a disposable test copy.
- Explain that public GitHub source code is visible and that production deployment needs different credentials and stronger infrastructure.

Demonstration credentials

Role	User ID	Password	Use in demonstration
Admin	admin	admin123	Accounts, audit trail, impersonation
Manager	rohit.sharma	manager123	Main Manager workflow
Manager	manager.rajesh	manager123	Role-separation example
Team Member	anita.kulkarni	auditor123	Fieldwork and observations
Team Member	vikram.n	auditor123	Team-assignment example
Team Member	neha.patil	auditor123	IT-audit persona
Device-bound demo	demo.viewer	AuditVault@Demo2026	First-computer activation only

Change every default password before using the application with real information.

The demo.viewer account is bound to the first computer where it is activated.
