Customer Order to ERP Converter – how it was built

Vegpro Kenya Limited | From an Excel customer order to a tool shared by the whole office on the LAN

1 BUILD THE TOOL

TOOL USED

Claude

Wrote the converter from my sample ERP file and customer order, then refined it with my business rules.

OUTPUT

One HTML file: ERP upload files, gross weight, FWL proposal, reports in Excel and PDF

2 LAN SERVER

TOOL USED

Google AI Studio

Given a prompt prepared by Claude, it generated the server code and install scripts.

OUTPUT

Zip of the LAN server project (Go code, scripts, guide)

3 FIX, COMPILE, TEST

TOOL USED

Claude

Corrected faults in the AI Studio zip, built the Windows program and tested it with several simulated users.

OUTPUT

Ready-to-run package with the .exe built

4 INSTALL AND SHARE

TOOL USED

Windows server PC

Ran **install.bat** as administrator. The program starts automatically with Windows.

OUTPUT

One web link that colleagues open in Chrome or Edge

5 EMAIL THE REPORTS

TOOL USED

Outlook (classic or new)

Email button in the tool saves the Excel and opens a draft in the default mail app with the subject filled. Add recipients and attach the file.

OUTPUT

Draft email: gross weight, or gross weight + FWL proposal

Where the work happens

Each user's browser does all order processing. Order files are never sent to the server.

What is shared

Only the ERP SKU master file. One upload is seen by everyone, with the last 20 versions kept.

Where it is stored

On the server PC, in **C:\VKL_Order_Converter\data**. Reports and ERP files download to each user's own PC. Email drafts hold no addresses.

Result: a multi-user office tool, with no software installed on colleagues' PCs Claude → Google AI Studio → Claude → Windows PC → Outlook

Technology: single-file HTML with JavaScript (Excel and PDF libraries built in); LAN server written in Go using only its standard library.
