

PROJECT SUMMARY

PharmaLink Connect

Student Name: Rajesh Kumar S.

MM No.: 213204

Course: AICA Level 2 – B91 Tanzania

Problem Statement

Pharmacy distributors need a faster and more reliable way to communicate medicine availability, new arrivals, prices, and special offers to pharmacy customers. The existing process depends heavily on phone calls, medical representatives, and manual follow-up, which can delay information and make order collection difficult.

Proposed Solution

PharmaLink Connect is a web-based platform that creates a direct connection between pharmacy distributors and pharmacy customers. Customers can browse a live medicine catalogue, view prices, offers, and new-arrival information, and submit order enquiries online. Distributors can review enquiries, update order status, and manage offers through a secure dashboard.

Technology Used

ChatGPT was used for planning, prompts, and documentation; **Lovable** was used to develop the web interface and dashboard; **Supabase** was used for the database, authentication, medicine records, and security; and **GitHub** was used to store capstone materials.

Key Features

- Public medicine catalogue with stock and prices in Tanzanian Shillings.
- Pharmacy sign-in, secure order enquiry submission, and “My Order Requests.”
- Distributor Dashboard to review enquiries and update status as Pending, Confirmed, or Rejected.
- Offers, discounted prices, and New Arrival badges in the catalogue.
- Role-based access for pharmacy customers and distributors.

Result and Conclusion

The PharmaLink Connect prototype was successfully developed and tested. It reduces dependence on manual calls, improves product visibility, and supports faster, structured communication between distributors and pharmacy customers.
