

PharmaLink Connect – Prompt File

1. Initial Project Creation

Create a web application named **PharmaLink Connect** for pharmacy distributors and pharmacy customers. The distributor should be able to share medicine availability, prices, new arrivals, and special offers. Pharmacy customers should be able to browse the catalogue and send order requirements. Create a professional pharmacy distributor landing page and product catalogue with a sample medicine item.

2. Connect the Catalogue to Supabase

Connect the existing catalogue to my existing **PharmacyMVP** Supabase project. Use the existing medicines table as the catalogue source. Replace only the sample catalogue item with live medicine data and keep the current design unchanged. Do not create a new Supabase project or enable Lovable Cloud.

3. Add Order Enquiry Feature

Add a simple **Order Enquiry** feature to the existing PharmaLink Connect catalogue. Keep the current design and catalogue unchanged. Add a **Request Order** button on each medicine card. Require pharmacy customers to sign in before submitting an enquiry. Store pharmacy name, contact number, selected medicine, quantity, and an optional note in a secure order enquiries table. Each user must see only their own enquiries.

4. Add My Order Requests Page

Add a **My Order Requests** link for signed-in pharmacy customers. Create a page that displays each user's own enquiries from the existing order enquiries table, including medicine name, quantity, note, and submission date. Keep the catalogue and existing design unchanged.

5. Distributor Dashboard, Offers, and New Arrivals

Add a secure Distributor Dashboard to PharmaLink Connect using the connected PharmacyMVP Supabase project. Only users with the distributor role can access it. The dashboard must show all incoming order enquiries with pharmacy name, contact number, medicine, quantity, note, and submission date. Allow the distributor to change each enquiry status to Pending, Confirmed, or Rejected.

Allow the distributor to add and edit medicine offers and mark medicines as New Arrival. Show Offer and New Arrival badges in the public catalogue. Keep the existing pharmacy-customer catalogue, sign-in, Request Order, and My Orders features unchanged. Create only the necessary database tables or columns and secure them with Row Level Security. Do not enable Lovable Cloud or redesign unrelated pages.

6. Final Enhancement Prompt

Complete the final two features in PharmaLink Connect using the existing PharmacyMVP Supabase project.

1. In the Distributor Dashboard, add a secure **Add Medicine** form. Only distributor-role users can access it. It must add a medicine to the existing medicines table with name, generic name, unit, selling price, stock quantity, reorder level, batch number, and expiry date. Distributors may edit medicines they manage.
2. On the pharmacy customer **My Order Requests** page, show the current status for each enquiry: Pending, Confirmed, or Rejected. Each pharmacy user must still see only their own enquiries.

Use the existing tables where possible. Add only necessary database columns or Row Level Security policies. Keep the current catalogue, Request Order, My Orders, distributor dashboard, offers, and New Arrival features unchanged. Do not enable Lovable Cloud and do not redesign unrelated pages.

Note: Prompt 6 is the planned final enhancement and may be completed when Lovable Build credits are available.
