

Income-tax Computation Tool

FY 2026–27

Development narrative, architecture and installation guide

A formula-led Excel concept converted into a Python desktop application

Prepared for AICA-Level-2 Projects

Sandeep (512632)

The problem the tool addresses

Tax preparation often starts with scattered inputs and ends with repeated manual checks.

- Common income and deduction streams sit across salary records, property data, business books and tax statements.
- Slab rates, special rates, rebate, surcharge, cess and interest need separate treatment.
- Client communication and working-paper output often require manual re-entry after the calculation.

The screenshot shows an Excel spreadsheet titled "Income-tax computation" for the Financial Year 2026-27. It is divided into sections for selecting taxpayer profile, reviewing results, and a detailed breakdown of taxable income by head.

1. Select the taxpayer profile

Resident status: **Resident** (dropdown) / Age category: **Below 60** (dropdown) / Tax regime: **New** (dropdown)

Use the three dropdowns above. The full computation updates automatically. Enter income and deductions on the inputs sheet.

2. Review the result

Total income	Gross tax liability	Net tax payable / (refund)
-	-	-

Taxable income by head

Income head	Taxable amount	Quick review	Status
Salary		- Regime	New
House property		- Business income	No
Business / profession		- Surcharge	Not required
Capital gains at slab rates		- Special-rate income	None entered
Other sources at slab rates		- Next step	Enter taxpayer name on Inputs
Special-rate income		-	

How to use

- 1 Choose the taxpayer profile above.
- 2 Open Inputs and fill only the pale-yellow cells.
- 3 Return here to review total income and tax payable. unusual items and later amendments before filing.

Note

Initial Excel interface

Design goal: one guided workspace for inputs, tax calculation, statutory interest, reports and client follow-up.

Prompt record: foundation and tax scope

01	Excel computation model	Prepare a linked, formula-driven worksheet for FY 2026–27 under the Income-tax Act, with common income and expense streams, slab rates and special rates.
02	Taxpayer controls	Add dropdowns for age, residential status, and the new or old tax regime on the first sheet.
03	Interface improvement	Make the workbook easier to toggle and understand, using a light colour theme.
04	Payment email	Add a separate worksheet for the recipient email, payment amount, due date and a draft email.
05	Interest provisions	Apply interest under Sections 234A, 234B and 234C.
06	Python conversion	Convert the working model into a Python file.

Prompt record: automation, output and visual refinement

07	Client email copy	Use the supplied advance-tax and self-assessment-tax reminder as the draft email in the Python application.
08	Prefill import	Read the Income Tax portal prefilled XML or JSON, fetch supported taxpayer information and calculate tax.
09	PDF output	Add a button that creates a clear PDF of the final tax calculation.
10	Subdued visual theme	Improve the colour theme and button design without making the interface vibrant.
11	Oval controls	Convert rectangular toggles to oval shapes, use different shades of one colour, then add a fine matching boundary.
12	Branding and credit	Add the Income Tax e-Filing logo and 'Anywhere Anytime' motto, plus the requested footer attribution.

Five guided sections

- Profile and regime selection
- Income and deductions
- Interest under Sections 234A, 234B and 234C
- Calculation results
- Payment email draft

Header actions cover calculation, prefill import, PDF export, save, open and reset.

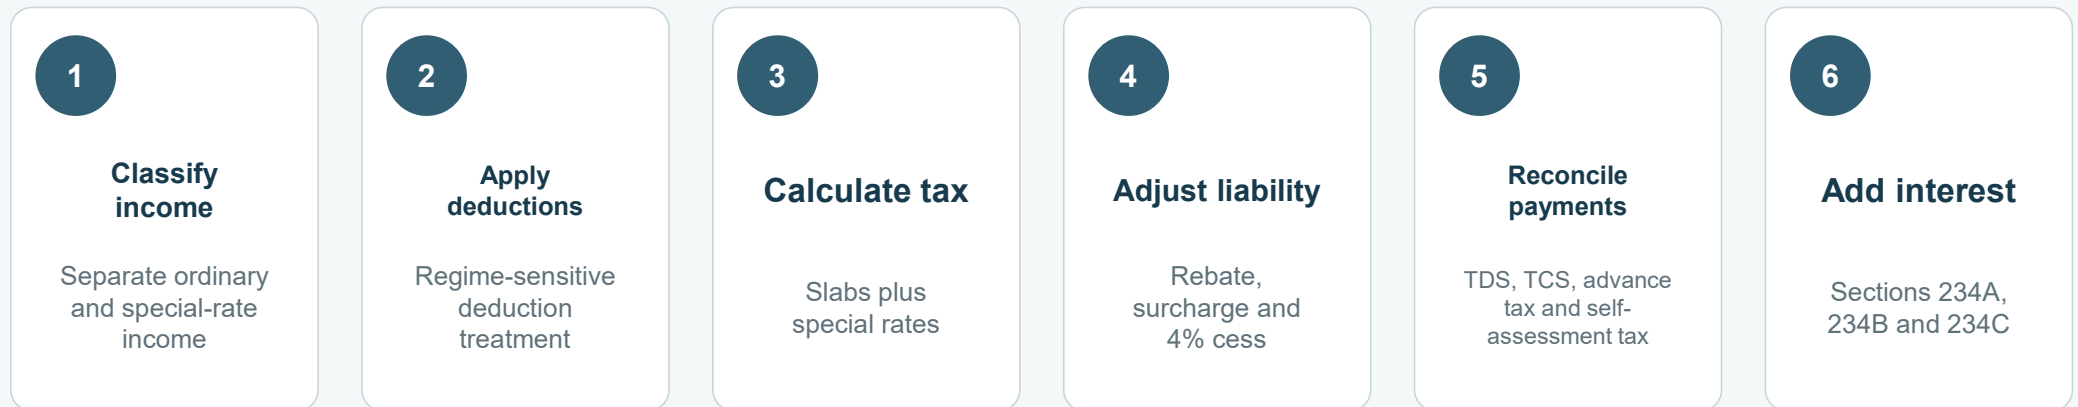

Application architecture

Tkinter desktop interface

The tool uses Python's standard library for the interface, JSON/XML handling and calculations. ReportLab adds PDF generation.

Tax computation sequence

Special-rate streams implemented: Section 111A gains at 20%, specified long-term gains at 12.5%, lottery income at 30%, and virtual digital assets at 30%.

Interest under Sections 234A, 234B and 234C

39

40

Important limitations

41

Interest is calculated at 1% per month or part thereof. Section 234C uses 15%, 45%, 75% and 100% cumulative targets, or 100% by 15 March for the assessed presumptive method.

42

Review relief for income arising after an instalment date, multiple self-assessment payments, reassessment, MAT/AMT credit, deferred ESCP tax and notified due-date extensions.

43

For FY 2026-27, corresponding provisions under the Income-tax Act, 2025 are reworded, while this workbook retains the familiar 234A/234B/234C descriptions.

01 234A

Uses the original return due date, filing date and tax outstanding after qualifying payments.

02 234B

Uses assessed tax, advance-tax sufficiency and the self-assessment or computation date.

03 234C

Tests cumulative advance-tax instalments against the applicable schedule.

The interface retains familiar legacy section labels. Users must review notified extensions and relief for late-arising income.

Prefill import and field mapping

JSON or XML

The file selector accepts Income Tax prefill files in either format.

Recursive parsing

Nested keys and XML elements are flattened into searchable paths.

Mapped fields

Supported taxpayer and income values populate the corresponding interface fields.

Review step

The user reconciles imported values with AIS, Form 26AS, Form 16, books and challans.

Import reduces re-entry. It does not replace professional reconciliation or return-utility validation.

OUTPUTS

Client communication and report output

	B	C	D	E	F	G	H
2	Tax payment email draft						
3	Prepare a payment reminder from the current tax computation						
4							
5							
6	1. Enter payment details						
7							
8	Field	Value	Guidance				
9	Recipient email address		Enter the email ID of the person who should receive the reminder.				
10	Tax liability from computation		This amount is linked to the rounded net tax payable. Refunds appear as zero for the reminder.				
11	Payment amount override (optional)		Use an override only when the intended instalment differs from the linked tax liability.				
12	INR amount for email		The draft uses the override when it is greater than zero; otherwise it uses the linked liability.				
13	Due date		Enter the actual statutory or agreed payment deadline.				
14							
15	2. Review the draft email						
16							
17	Email field	Draft					
18	To	[Enter recipient email above]					
19	Subject	Income-tax payment reminder - FY 2026-27					
20							
21	Email body						
22	Complete the recipient email, payment amount and due date to generate the draft.						
23							
24							
25							
26							
27							
28							
29							
30							
31	Draft status	Enter recipient email					
32	This worksheet prepares a draft only. Review the recipient, amount and due date before sending from your email application.						

Payment email

- Recipient email address and tax type
- Calculated payment amount with optional override
- Payment due date and firm sign-off
- Copy-ready draft using the supplied client wording

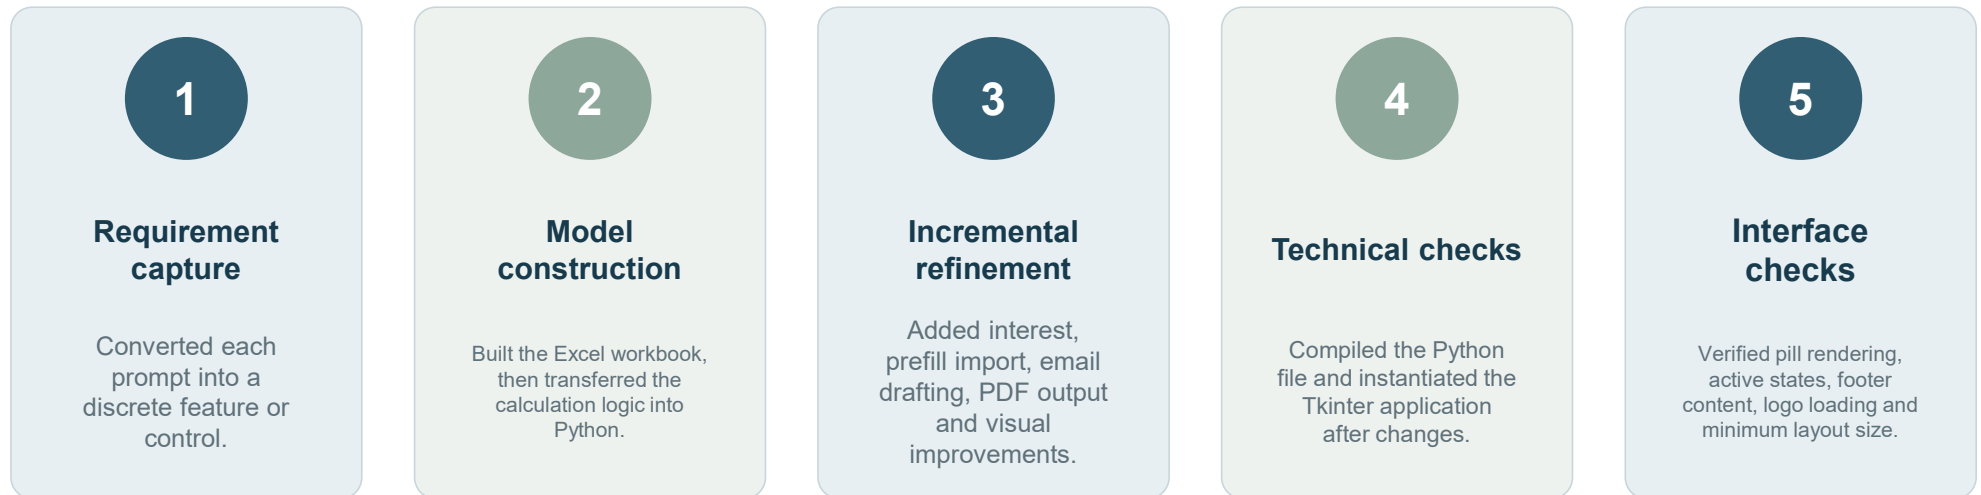

PDF tax computation

The Export PDF action creates a structured A4 report covering taxpayer details, income by head, tax build-up, credits, interest and preparation notes.

Interface design decisions

- | | | |
|----|--------------------------|---|
| 01 | Subdued palette | Blue-grey, sage and warm neutral tones reduce glare and keep tax data prominent. |
| 02 | Pill controls | Oval action and navigation buttons use related shades, hover states and a fine matching boundary. |
| 03 | Guided navigation | Five sections match the order in which a practitioner prepares and reviews a computation. |
| 04 | Visible status | The footer reports calculation or import status while retaining the requested project credit. |
| 05 | Official identity | A dedicated white strip preserves the e-Filing logo and 'Anywhere Anytime' motto. |

Development and verification process

Verification is proportionate to a preparation aid. Statutory review and independent test cases remain necessary before production use.

Installation on Windows

Required files

- income_tax_computation_fy_2026_27.py
- assets\income_tax_efiling_logo.png

Software

- Python 3.10 or later for Windows
- Tkinter, normally included with the standard Windows Python installer
- ReportLab for PDF generation

Command Prompt

```
cd <folder-containing-the-tool>

py -m venv .venv

.venv\Scripts\activate

python -m pip install reportlab

python income_tax_computation_fy_2026_27.py
```

Keep the assets folder next to the Python file. Without ReportLab, the calculator still opens, but PDF export remains unavailable.

Operating guide and control points

Typical workflow

- Select age, residential status and tax regime.
- Enter data manually or import a supported prefill JSON/XML file.
- Complete income, deduction, payment and statutory date fields.
- Review the tax result and Section 234 interest breakdown.
- Export the PDF and copy the payment email after review.

Professional review before filing

- Reconcile AIS, Form 26AS, Form 16, books and tax challans.
- Confirm regime eligibility, deductions and special-rate classification.
- Review notified due-date extensions and relief for late-arising income.
- Test unusual transactions and multiple payment dates separately.
- Use the official return utility for filing and final validation.

The application is a computation and working-paper aid. It does not replace professional judgment or statutory filing software.
