

CA PracticeOS Compliance

Standard Operating Procedure (SOP)

Section-by-section reference: purpose, workflow, and troubleshooting

Live app: https://cashubhammishra-ctrl.github.io/CA_PracticeOS_Compliance/CA_PracticeOS_Compliance.html

Backend API: <https://ca-practiceos-backend.onrender.com>

Prepared for: CA PracticeOS Compliance — AICA Level 2 — Capstone Project — CA Shubham Mishra —
Batch L2B89

This document is a working reference, not a substitute for professional judgement. Every section below assists with drafting, calculations, and internal workflow — the signing Chartered Accountant remains responsible for verifying applicable law, ICAI standards, facts, and the final document before issue.

How to read this SOP

Each entry below covers one screen or feature of the app, in the same order as the left sidebar. Every entry has three parts: **What it's for** (the purpose in one or two sentences), **How it works** (the actual mechanics — what happens when you click what), and **If not working — what to do** (the specific, concrete fix for that screen, not a generic "contact support").

Screenshots were captured from the live public app on 2026-09-20, logged in as a test firm admin. Some screens show placeholder/sample data (client counts of 0 or 1) since this was a fresh test account — your firm's real data will populate the same layout.

0. Login & Signup Gate

The image shows a login and signup gate for 'CA PracticeOS Compliance'. The header includes the company name and the tagline 'Professional Document & Compliance Suite'. Below this are two input fields: 'Email' with the placeholder 'you@yourfirm.com' and 'Password' with the placeholder 'Password'. A prominent yellow 'Log In' button is centered below the fields. At the bottom, there is a link for 'New firm? Request access'.

WHAT IT'S FOR

The entry point for every user. This is a real, multi-firm authentication system — not a single shared password. It gates every other screen in the app.

HOW IT WORKS

A new firm clicks **"Request access"** and submits their name, email, password, and firm name. This creates a pending account and emails the platform owner (cashubhammishra@gmail.com) an Approve/Reject link. Once approved, that person can log in with the email/password they chose, and becomes the Admin of their own firm's data — completely isolated from every other firm using the app. Existing users just enter their email and password and click Log In.

IF NOT WORKING — WHAT TO DO

Signup submitted but no approval email arrives: check the backend's email provider (Resend) is configured — in Render's Environment tab, RESEND_API_KEY and RESEND_FROM must be set; without them the signup still succeeds but the notification email silently fails. **"Incorrect email or password":** the account may not exist yet, or the password was mistyped — there is no password reset flow yet, so a mistyped signup password requires re-signing up with a different email or a manual DB fix. **"Your access request is still pending admin approval":** the platform owner has not yet clicked Approve in the email — check spam folder or resend via the platform admin page (see Section 26). **"Your access request was not approved":** the account was explicitly rejected or later revoked — see Section 26 to restore it if that was in error.

1. Dashboard

WHAT IT'S FOR

The landing page after login. Gives an at-a-glance view of the firm's activity and quick access to the most common actions.

HOW IT WORKS

KPI tiles (Clients, Documents, UDIN Pending, Net Worth Drafts) are live counts pulled from this firm's own data. "Quick Create" buttons jump straight into the most-used document generators. The "Firm Setup" card links to the Firm Setup Wizard for first-time configuration. "Recent Documents" lists the last 5 items from the Document Register with their current status.

IF NOT WORKING — WHAT TO DO

Counts show 0 even though data was added: for logged-in firms, client/document data is stored server-side per firm (Supabase database) — refresh the page or check that login succeeded (see the firm name shown top-left of the sidebar). **Firm name/branding wrong:** go to Settings (Section 25) and update the Firm Profile fields.

2. AI Agents

The screenshot shows a web application titled "AI Agents" with a subtitle "Offline first • Browser-based • Data stored locally on this device". It features two buttons at the top: "Export Backup" and "Import Backup". Below these is a progress bar labeled "Runs / 100".

The main content area is divided into four sections:

- AI Agent Layer:** Contains a descriptive paragraph about the agents and a text input field for the "AI Backend URL" with the value "https://ca-practiceos-backend.onrender.com".
- Agent 3 — Compliance Checklist:** Labeled as a "Headline Feature". It includes a description of its function, a "Document Type" dropdown menu set to "Auto-detect", and a large text area for "Drafted Document Text". A "Run Compliance Check" button is at the bottom.
- Agent 2 — Document Drafting:** Describes how a plain-English instruction is turned into a draft. It has a text input for a description, a pre-filled example "Prepare an engagement letter for ABC Pvt Ltd for tax audit AY 2025-26", and two buttons: "Generate Draft" and "Check Compliance on This Draft".
- Agent 1 — Client Onboarding:** Describes the process of uploading a PAN card or GST certificate. It has a text input for the upload and an "Extract Client Details" button.

At the bottom, a small disclaimer reads: "CA PracticeOS — Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA."

WHAT IT'S FOR

The AI reasoning layer of the app — three agents that call a Python/FastAPI backend (not just this browser file) to do real document intelligence work. Agent 3 (Compliance) is the headline feature of this build.

HOW IT WORKS

Agent 3 — Compliance Checklist: paste a drafted document's text, pick or auto-detect its type, and the agent checks the actual text against that document type's mandatory-clause checklist, returning a pass/fail with exactly what's missing and quoted evidence for what's present. **Agent 1 — Onboarding:** upload a photo/PDF of a PAN card or GST certificate; the agent extracts a validated Client Master row (name, entity type, PAN, GSTIN, address) which can be added straight into Client Master. **Agent 2 — Drafting:** type one plain-English instruction (e.g. "Prepare an engagement letter for ABC Pvt Ltd, tax audit AY 2025-26, fees ₹50,000") and the agent extracts the parameters and produces a filled draft, which can be immediately run through Agent 3.

IF NOT WORKING — WHAT TO DO

"AI Backend URL" field is empty or wrong: it should read <https://ca-practiceos-backend.onrender.com> — reset it if changed. **Requests hang for 30–60 seconds on first use:** normal — Render's free tier spins the backend down after inactivity; the first request wakes it up. **500 error / "Extraction failed":** the backend's ANTHROPIC_API_KEY may be missing, expired, or rate-limited — check Render's Environment tab and the Render deploy logs. **Compliance check returns an unexpected document type:** switch "Document Type" from Auto-detect to the correct type manually.

3. Team Members

WHAT IT'S FOR

Real, server-backed login access control for a single firm — this is the actual place to add employees (Preparer/Reviewer/Approver/Admin) and to revoke or restore their access. Not to be confused with the Firm Setup Wizard's email-routing card (Section 23).

HOW IT WORKS

Only a user with `is_tenant_admin = true` (the firm's own Admin) sees the add-member form and the Revoke/Restore buttons — this is enforced on the server, not just hidden in the UI. Adding a member creates a real account (email + password + role) tied to this firm's tenant ID; that person can then log in independently. Revoking sets their account status to "rejected", which blocks any future login attempt immediately; Restore reverses it. There is no limit on how many members a firm can add.

IF NOT WORKING — WHAT TO DO

Can't see the "Add Team Member" form: only the firm's Admin sees it — log in as the account that originally signed up and was approved, or have that Admin promote another member to the Admin role. **Revoke button does nothing:** the browser's native "Are you sure?" confirmation popup must be accepted — click OK, not Cancel. **Revoked member can still access the app after being revoked:** their existing session token (valid up to 7 days) still works until it expires — revoking blocks new logins, it does not instantly kill an already-open session. **Need to remove access for an entire firm, not just one member:** that's a different, platform-owner-only control — see Section 26.

4. Client Master

Client Master
Offline first • Browser-based • Data stored locally on this device

Export Backup

Import Backup

Print / PDF

Search client

Name / PAN / GSTIN

Download Template

Upload / Update Client Master

Dynamic Columns Supported

+ Add Client

Upload an Excel/CSV client master in bulk. Existing clients are matched primarily by PAN, then GSTIN, then exact client name: matched records are updated and new records are added. Review the imported data before relying on it for any professional document.

CSV parser: UTF-8 CSV, quoted values, commas inside quoted fields and UTF-8 BOM are supported. You can use the downloaded CA PracticeOS template directly.

Client	Entity	PAN	GSTIN	Cont
Riverstone Traders Pvt Ltd	Private Limited Company	ABCD1234F	07ABCD1234F1Z5	
New UI Test Client	Individual	ZZTE59999Z		

CA PracticeOS • Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA.

WHAT IT'S FOR

The single client database shared across every document generator, checklist, and register in the app.

HOW IT WORKS

Add clients one at a time via "+ Add Client", or bulk-import via "Upload / Update Client Master" (CSV/Excel, matched to existing records by PAN, then GSTIN, then exact name). "Dynamic Columns Supported" means extra columns in an uploaded file are kept as custom fields without needing code changes. This is also the exact table Agent 1's output is designed to import into.

IF NOT WORKING — WHAT TO DO

Upload says format not recognized: click "Download Template" first and match its exact column headers. **A client I added isn't showing in a document generator's client dropdown:** refresh that generator's page — dropdowns are populated on page load. **Duplicate clients after upload:** the match key is PAN first — if PAN was blank or inconsistent across rows, matching falls back to GSTIN then exact name, which can create duplicates if none of those match cleanly; clean the source PAN column and re-upload.

5. Securities / ISIN Master

Securities / ISIN Master
Offline first • Browser-based • Data stored locally on this device

Export Backup

Import Backup

Print / PDF

Search holding

Client / Security name / ISIN

Download Template

Upload / Update Securities Master

+ Add Holding

Upload an Excel/CSV securities / ISIN master in bulk (shares, mutual funds, bonds, debentures). Holdings are matched to a client primarily by PAN, then Client Name — clients not already in the Client Master will need to be added there first, or the holding is kept unlinked until then. Use this to auto-fill the Investments / Shares section of a Net Worth Certificate.

Client	Security Name	ISIN	Type	Quantity	Value (₹)
Riverstone Traders Pvt Ltd	Infosys Ltd	INE009A01021	Equity	100	₹2,85,000
Riverstone Traders Pvt Ltd	HDFC Flexicap Fund	INF179K01158	Mutual Fund	500	₹6,10,000
—	Tata Consultancy Services	INE467B01029	Equity	50	₹7,50,000

CA PracticeOS • Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA.

WHAT IT'S FOR

A holdings register (shares, mutual funds, bonds, debentures) that feeds directly into Net Worth Certificates.

HOW IT WORKS

Bulk-upload holdings via CSV/Excel; each row is matched to an existing Client Master record by PAN, then by exact client name. Inside the Net Worth Certificate generator, "Load from Securities / ISIN Master" pulls a client's holdings straight into the Assets table instead of typing them in by hand.

IF NOT WORKING — WHAT TO DO

"No securities holdings found" when loading into Net Worth Certificate: the client must already exist in Client Master before their holdings can link — add the client first, then re-upload the securities file. **Upload rejected:** use "Download Template" to get the exact expected columns.

6. Document Register

WHAT IT'S FOR

The master log of every document generated anywhere in the app, with its status (Draft → Submitted for Approval → Approved/Returned → Issued/Superseded).

HOW IT WORKS

Every document generator (Engagement Letter, Certificate, etc.) writes an entry here automatically on save. The maker-checker approval workflow (submit → approve/return) operates on entries in this register. Filter by status using the dropdown; "Clear Register" wipes the log for this firm.

IF NOT WORKING — WHAT TO DO

A document I generated isn't listed here: confirm it was actually saved (not just previewed) from its generator screen. **Status stuck on "Submitted for Approval":** the configured Approver needs to open it via the Approval Queue and click Approve or Return — see Section 23 for how the approval email routing is configured.

7. Engagement Letter Generator

Engagement Letter
Agent 3 will generate a draft engagement letter based on the data entered.

Generate Draft Reset

© 2024 Tally Solutions Pvt. Ltd. All rights reserved. Tally is a registered trademark of Tally Solutions Pvt. Ltd. Tally is not responsible for any data loss or damage caused by the use of Tally. Tally is not a professional and its use is at the user's own risk.

WHAT IT'S FOR

Produces a fully formatted engagement letter for 10 assignment types (Statutory Audit, Tax Audit, GST Consultancy, Net Worth Certificate, Due Diligence, etc.), with firm letterhead, scope, fees, and confidentiality clauses.

HOW IT WORKS

Pick a client and assignment type; the built-in GST engine automatically computes CGST/SGST/IGST based on the supplier's registered state, the legal place of supply, and where the service is actually rendered — not a flat guess. The generated draft can be fed straight into Agent 3 (Compliance) to check it against the mandatory-clause checklist for that assignment type.

IF NOT WORKING — WHAT TO DO

GST comes out wrong: check the firm's registered GST state is set correctly under Settings, and that the client's state/SEZ status is correct in Client Master — SEZ status is read from Client Master, never inferred from GSTIN alone. **Agent 3 marks a generated letter as failing:** that means the letter's own template is missing a clause the checklist requires — this is a genuine finding, not a bug; add the missing clause language to the draft.

8. Net Worth Certificate

[illegible]

WHAT IT'S FOR

Generates a Net Worth Certificate with itemised assets/liabilities, each with an evidence or basis note, plus UDIN and Membership Number fields.

HOW IT WORKS

"Load Typical Items" seeds common asset/liability categories; "Load from Securities / ISIN Master" pulls a client's actual holdings in (Section 5). Totals, net worth, and net worth in words are computed automatically as rows are added.

IF NOT WORKING — WHAT TO DO

Net worth total looks wrong: check each row's value field individually — the total is a straight sum, so one mistyped row skews it. **UDIN field left blank in the final document:** this is intentional when UDIN is still pending — track it via the UDIN Register (Section 13) and update the certificate once generated.

WHAT IT'S FOR

Generates 10 other certificate types — Turnover, Capital Contribution, Utilisation, Solvency, Stock, Debtors, Creditors, Financial Position, Balance Confirmation, and a generic "Other".

HOW IT WORKS

Same client-linking and GST-aware fee handling as the Engagement Letter generator. Select the certificate type, fill the specific fields it asks for, and generate.

IF NOT WORKING — WHAT TO DO

The certificate type I need isn't listed: use "Other" and manually adjust the generated text, or note it for a future update to this list.

10. Representation Letter

Specific Representations / Matters

All information and records relevant to the assignment have been mad

Generate Draft

CA PracticeOS • Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA.

WHAT IT'S FOR

A client-side representation letter tied to a specific assignment and period, with an explicit client responsibility-acknowledgement clause.

HOW IT WORKS

Select the client and assignment; the letter is generated with the standard representation-letter structure and saved to the Document Register.

IF NOT WORKING — WHAT TO DO

Wrong assignment period appears: the period field is manually entered each time — double-check it before generating, it is not pulled from another screen.

11. Working Paper

Working Paper
Offline first • Browser based • Data stored locally on this device

Conclusion / Exceptions

Generate Working Paper

CA PracticeOS • Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA.

WHAT IT'S FOR

The standard audit working-paper shape: objective, procedures performed, evidence/exceptions, conclusion, and a Prepared By / Reviewed By sign-off row.

HOW IT WORKS

Fill each section as the actual work is performed; the sign-off row is meant to be completed at maker-checker time, matching the Document Register's approval status for this item.

IF NOT WORKING — WHAT TO DO

Sign-off names don't match Team Members: this field is free text, not linked to real accounts — type the correct names manually; it is a documentation field, not an access control.

12. Checklists

WHAT IT'S FOR

Six procedural checklists (Net Worth Certificate, Statutory Audit, Tax Audit, General Certificate, Bank Finance/CMA, GST Assignment) — process steps like "bank statements obtained" or "client representation obtained".

HOW IT WORKS

Tick items off as they're completed for a given assignment. This is deliberately a different kind of checklist from Agent 3's clause-presence checks (Section 2) — this one tracks whether a workflow step happened; Agent 3 checks whether a document's text contains a required clause.

IF NOT WORKING — WHAT TO DO

Checklist items reset unexpectedly: checklist state is saved per browser session on this device for local use — if working from a different device or after clearing browser storage, ticks will not carry over. Server-synced checklist state is not yet built.

13. UDIN Register

UDIN Register
Offline-first • Browser-based • Data stored locally on this device

Export Backup

Import Backup

Print / PDF

UDIN Register

Use this as an internal tracking register. It does not generate or validate a UDIN. Always complete the applicable official ICAI UDIN process and independently verify current requirements.

+ Add UDIN Record

Download UDIN Template

Upload / Update UDIN Excel/CSV

Use this register to track UDIN against the firm's final certificates/reports. Upload can add new rows or update existing rows by UDIN or certificate number. It does not generate or validate UDINs with ICAI.

Date	Client	Document
2026-09-19	Select	Engagement Lette
2026-09-19	Select	Turnover Certifica

CA PracticeOS • Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA.

WHAT IT'S FOR

Internal tracking only for UDIN numbers issued against certificates — this app does not generate or validate a UDIN with ICAI directly.

HOW IT WORKS

Bulk upload or manually update UDIN/certificate number pairs to keep an internal log of what's issued vs. pending.

IF NOT WORKING — WHAT TO DO

Expecting this to fetch or validate against ICAI's UDIN portal: it doesn't — UDIN must still be generated on ICAI's own portal; this register is only a local tracking log to avoid missing one.

14. Professional Fees & GST

Vault Register

Date	Client	Type	File	Hash
No files recorded.				

CA PracticeOS • Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA.

WHAT IT'S FOR

Upload storage for signed letters, reports, financial statements, and deeds against a specific client and assignment, with a register showing file hash and status.

HOW IT WORKS

Upload a file against a client/assignment; the app records a hash of the file alongside it, so a later check can confirm the stored file hasn't been altered.

IF NOT WORKING — WHAT TO DO

Large file won't upload: this is a browser-local storage feature (IndexedDB) — very large files or very many files can hit the browser's storage quota; export/clear old items if uploads start failing.

17. Contracts & Deeds

Contracts & Deeds

Offline first • Browser-based • Data stored locally on this device

Contract Register

Client	Type	No.	Effective	Renewal
No contracts/deeds recorded.				

CA PracticeOS • Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA.

WHAT IT'S FOR

A metadata register for service agreements, engagement agreements, loan agreements, partnership/LLP/trust deeds, leases, and vendor contracts — with renewal dates and review status.

HOW IT WORKS

Log the contract's key details and its renewal/review date; use this as a simple tickler list for what needs attention and by when.

IF NOT WORKING — WHAT TO DO

Renewal reminders aren't emailed: there is no automatic email reminder yet — this register is a manually-checked list, not an automated alert system.

18. Digital Signatures / eSign Centre

Digital Signatures

Offline first • Browser-based • Data stored locally on this device

Export Backup

Import Backup

Print / PDF

How DSC / Digital Signature is Embedded

1. Final PDF is generated → 2. cryptographic hash/digest/signature is created → 3. signer signs using a DSC token or approved eSign service → 4. the signature object and signing certificate are embedded in the PDF → 5. the recipient can validate signer, certificate chain, timestamp and whether the PDF changed after signing.

CA PracticeOS should never store the DSC private key. For production, use an approved final signing bridge/DSC component or an appropriate eSign API, with the signing operation occurring under the signer's control.

Digital Signature / eSign Centre

For production, use a CCA-compliant DSC/eSign provider or approved signing component. The application should not collect or store a user's DSC private key. This prototype records signing metadata and document hashes only.

Client

Riverstone Traders Pvt Ltd • ABCDE1234F

Create Signature Record

Calculate SHA-256 Hash

Signature Register

Date	Client	Document	Signer	Method	Status
No signature records.					

CA PracticeOS • Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA.

WHAT IT'S FOR

Explains the real DSC signing chain and records signing metadata — deliberately does NOT store or handle actual private keys.

HOW IT WORKS

Shows the conceptual flow: hash the document → sign with a token/eSign service → embed signature + certificate → recipient validates. Only the metadata (who signed, when, document hash) is recorded here.

IF NOT WORKING — WHAT TO DO

Expecting this screen to actually sign a PDF: it doesn't, by design — CA PracticeOS should never handle a real DSC private key inside a browser app; use your firm's actual DSC token/software to sign, then log the fact here.

19. Integrations

Integrations

Export Backlog

Import Backlog

API:

Save Zoho Connector

©2023 Productivity Cloud System. All rights reserved. All trademarks are the property of their respective owners.

WHAT IT'S FOR

Lists planned/prototype integrations — OneDrive/SharePoint (Microsoft Graph OAuth), generic accounting-software CSV import/export, and Zoho — explicitly scoped as settings-only in this build.

HOW IT WORKS

This screen stores connection settings/preferences; it does not itself hold or transmit real credentials from this browser file — those belong in the production backend.

IF NOT WORKING — WHAT TO DO

Expecting a live OneDrive/Zoho sync: not built in this version — the screen is intentionally honest that production credential handling belongs server-side, not in this static HTML file.

20. Tally Connector

Tally Connector

Offline-first • Browser-based • Data stored locally on this device

Export Backup

Import Backup

Print / PDF

Tally Connector

How this works: this connects directly from your browser to Tally Prime's own built-in XML/HTTP gateway on your local machine — no separate server or install needed for this L1 connector. In Tally Prime: **F1 → Settings → Connectivity → Client/Server configuration** → set "TallyPrime acts as: Server", Port **9000**, then open the company you want to connect to. This only works when Tally Prime is running on the **same machine or local network** as this browser — it cannot reach a cloud-hosted copy of this app, and some browsers may block the request as cross-origin (CORS); if Test Connection keeps failing after checking the above, that is the likely reason.

Tally Server URL

http://localhost:9000

Company Name (blank = active company in Tally)

Exact company name as shown in Tally

Test Connection

Fetch Companies

Fetch Ledgers

Result

Run a fetch above to see results

CA PracticeOS • Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA.

WHAT IT'S FOR

A real, working connection directly from this browser to a locally running Tally Prime instance — not a mock, and not routed through the Python backend for this specific feature.

HOW IT WORKS

Talks to Tally Prime's own XML/HTTP gateway (default port 9000) using a small CORS relay (included in this repo's connectors/ folder) that runs alongside Tally on the same machine, since Tally does not answer cross-origin preflight requests on its own. Once connected, it can fetch company lists, ledgers, and outstanding invoices directly from Tally.

IF NOT WORKING — WHAT TO DO

"Failed to fetch" / "Could not connect to Tally": first confirm Tally Prime is actually running, a company is open, and F1 → Settings → Connectivity has "TallyPrime acts as: Server" on port 9000. Test this directly by opening <http://localhost:9000> in a new browser tab — if that also fails to load, Tally itself isn't reachable yet and the fix is entirely on the Tally-configuration side. **If that test tab DOES load, but the connector still fails:** this is CORS, not a secure-page restriction — modern browsers treat <http://localhost> as reachable even from an HTTPS page (it's an exception carved out for local development), so the public GitHub Pages link works fine for this feature too. The actual blocker is that Tally's own gateway sends no CORS headers at all, so the browser refuses to read its response. The fix is the small CORS relay already included in this repo (connectors/tally_browser_relay.py) — run it locally alongside Tally, point "Tally Server URL" at the relay's port (9001) instead of Tally's own 9000, and it forwards the request server-to-server, which isn't subject to CORS at all. **Why a real cloud product would do this differently:** a production version would still use a small local agent installed on the accountant's machine, but one that actively pushes data up to the cloud backend over an ordinary outbound HTTPS call on its own schedule, rather than waiting for the browser to ask — the web app would then only ever read from that backend, never talk to Tally directly at all. That agent is designed for, not built, in this timeline — today's direct connection (browser → relay → Tally) proves the underlying integration genuinely works. **Garbled or partially blank results once connected:** Tally's XML sometimes embeds illegal control characters in group/company names — the app already sanitizes these, but a very unusual company name could still cause an issue; check the browser console for a parse error and report the exact company/group name.

21. Reconciliation

Generate Reconciliation

CA PracticeOS • Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA.

WHAT IT'S FOR

A structured way to compare the firm's books against an external source, quantify differences, and document follow-up before a report or certificate is finalized.

HOW IT WORKS

Enter both sides of a comparison (books vs. external source) for a given head; the difference is computed and a follow-up note can be attached before the item is considered resolved.

IF NOT WORKING — WHAT TO DO

Reconciling items never seem to clear: this is a manual worksheet, not an automated bank-feed reconciliation — each item must be manually marked resolved once the difference is explained.

22. Security & DPDP Centre

WHAT IT'S FOR

The app's honest self-assessment of its own security posture — RBAC roles, MFA policy selector, auto-lock timer, a full audit trail, DPDP registers, and a Production Security Checklist that explicitly lists what is still backend-only and not yet implemented client-side.

HOW IT WORKS

The audit trail logs every meaningful action taken anywhere in the app (exportable as JSON) for this browser/session. The Production Security Checklist is a 12-item honesty list — items like server-side MFA/RBAC enforcement, tenant isolation, encryption, WAF, and penetration testing are called out as needed for a true production deployment, not silently assumed to be done.

IF NOT WORKING — WHAT TO DO

Audit trail seems incomplete: it only logs actions taken in the current browser/session for local-use features — real login/team/revoke actions are separately logged server-side in the FastAPI backend (Render logs), not in this local audit trail. **Checklist item marked as missing and you need it fixed:** that is the accurate, current state — raise it as a specific follow-up task rather than assuming it's already covered elsewhere.

23. Firm Setup Wizard

WHAT IT'S FOR

First-time configuration: upload the firm's profile and Client Master in bulk, and (further down the same page) configure who gets emailed when a document is submitted for review. **Important:** the bottom card here ("Document Review Email Routing") does NOT control who can log into the app — see the note below.

HOW IT WORKS

Step 1 uploads firm identity (name, CA/partner name, membership no., FRN, address) which then appears on every generated document's letterhead. Step 2 bulk-imports the Client Master (same mechanism as Section 4). Step 4, "Document Review Email Routing" (previously mislabelled "Firm Access Control"), only sets which email address receives a mailto: notification when a document is submitted, approved, or returned for changes — it is local-browser-only and creates no real accounts. **Real login access for Preparers/Reviewers/Approvers is managed entirely in Team Members (Section 3), not here.**

IF NOT WORKING — WHAT TO DO

Firm name/logo not appearing on generated documents: re-upload the Firm Profile in Step 1, or check Settings (Section 25) directly. **Added someone here expecting them to be able to log in:** they can't — this card only stores an email/name label for notification routing; go to Team Members and add them there instead for real login access. **Test Approval Email button does nothing visible:** it opens your device's default mail client with a pre-filled draft (mailto: link) — if no mail client is configured on the device, nothing will visibly happen.

CA PracticeOS • Local browser utility • Drafting and workflow assistance only • Final professional responsibility remains with the signing CA.

WHAT IT'S FOR

Firm profile fields (name, CA/partner name, membership number, FRN, address, contact, GST registration state) that flow into every generated document's letterhead and footer, and into the GST engine's supplier-state input.

HOW IT WORKS

Fill in each field once; every document generator and the GST Tax Engine reads from these same values rather than asking again per document.

IF NOT WORKING — WHAT TO DO

GST calculations are wrong across every generator at once: almost always traces back to an incorrect "GST State" here — fix it in one place rather than in each generator separately.

25. Platform-Owner Firm Management (outside the app)

Not part of CA_PracticeOS_Compliance.html itself — a separate backend page only the platform owner (cashubhammishra@gmail.com) can reach, for approving new firm signups by email and revoking/restoring an entire firm's access at any time afterwards. A screenshot is omitted here because this page's HTTPS origin blocks it from talking to the local tool used to capture the other screenshots in this document — the page itself works correctly when opened directly.

WHAT IT'S FOR

Lets the app owner see every firm that has ever signed up, with the admin's name/email, member count, and current status, and revoke or restore the entire firm's access with one click — independent of any firm's own Team Members page.

HOW IT WORKS

Open https://ca-practiceos-backend.onrender.com/api/admin/firms?secret=YOUR_SECRET in any browser, where YOUR_SECRET matches the PLATFORM_ADMIN_SECRET environment variable set in Render. Clicking Revoke sets every user in that firm's tenant to a blocked status immediately; Restore reverses it. This is separate from, and overrides, whatever a firm's own Admin has set for their individual team members.

IF NOT WORKING — WHAT TO DO

Page returns "Invalid or missing admin secret": the secret in the URL doesn't match Render's PLATFORM_ADMIN_SECRET value — re-check for typos, extra spaces, or that the variable was actually saved in Render's Environment tab. **A firm doesn't appear in the list:** they haven't completed signup yet — this page lists tenants that exist in the database, not pending form submissions. **Revoke/Restore link 404s:** confirm the backend has redeployed the latest code — check Render's Deploys tab for the current live commit.

Appendix — System Summary

Component	What it is	Where it lives
Frontend (L1 app)	CA_PracticeOS_Compliance.html — single-file browser app, PWA-installable	GitHub Pages
Backend API	FastAPI (Python), 3 AI agents, auth, team management, Tally-adjacent endpoints	Render (free tier)
Database	Tenants, Users, Clients — SQLAlchemy models	Supabase Postgres (permanent)
Email	Signup approval notifications	Resend API
Tally Connector	Direct browser → local CORS relay → Tally Prime	Runs on the accountant's own machine

Known free-tier constraints worth remembering: Render's backend spins down after ~15 minutes of inactivity, causing a 30–60 second delay on the first request after idle time — this is a hosting cost tradeoff, not a bug. Supabase's free database pauses after 7 days of total inactivity but is resumable from its dashboard within a year, and does not hard-expire the way Render's free Postgres would have.
