Prompt for PDF Utility

I want to create a Python desktop application for managing PDF files. I am a student and this is a training project, so please make the application simple, clean and easy to understand, but it should work properly.

Please create a PDF Utility named **RAA PDF Utility** with a PDF preview area. The application should have these main features:

1. Open and preview a PDF file.
2. Extract selected pages or page ranges and save them as PDF.
3. Insert pages from another PDF before or after a selected page.
4. Sign a PDF using either text or an image. The signature should be movable and resizable on the preview.
5. Mask/redact selected words or sensitive text from the PDF.
6. Clear printing, copying and editing restrictions from a PDF.
7. Combine multiple PDF files in the selected order.
8. Optimize/compress the PDF with different compression levels.
9. Provide **Open, Save, Save As, Close and Quit** options.

Use suitable Python libraries wherever required. Keep the interface professional but not unnecessarily complicated. Use a sidebar for the different PDF tools and show the active PDF on the right side.

Please provide the **complete working Python code**, including all GUI and PDF processing functions, so that I can run it directly on my computer. Also mention the required libraries and installation command. Make sure proper error messages and success messages are displayed wherever required.
