ChatVault

ICAI · L2B105 · By Vihit Vasani (MRN 147038)

WhatsApp chats, archived as records you can rely on

Turns a WhatsApp export into an organised, searchable, encrypted archive with SHA-256 fingerprints and evidence-ready outputs, all on the user's own device.

THE PROBLEM

Business runs on WhatsApp

Instructions, approvals, invoices and confirmations are exchanged there every day, outside any record system.

Exports are hard to use

WhatsApp gives one plain text file and loosely named media: no layout, no proper search, no structure.

Weak as evidence

Nothing proves a chat is unaltered. Section 63 of the Bharatiya Sakshya Adhiniyam asks for a hash certificate.

HOW IT WORKS

1. **Export from the phone** — Chat → Export chat → Include media
2. **Import and fingerprint** — SHA-256 of the ZIP and every file
3. **Read, search, analyse** — Phone-style view, insights, AI summary
4. **Store securely** — AES-256, local or online-drive folder
5. **Export and certify** — PDF, evidence bundle, Section 63 draft

USE CASES

CA and tax practice

Preserve client instructions, confirmations and documents for notices, assessments, GST matters and search proceedings, filed by client and financial year.

Litigation and disputes

Produce chats as evidence: numbered annexures, recovered deleted messages, a hash report and a draft Section 63 certificate.

Business records and audit

Keep vendor, customer and team conversations as an audit trail, with roles, an audit log and redaction before sharing.

Personal and family records

Archive property deals, NRI matters and family decisions made over WhatsApp, including Gujarati and Hindi messages.

FEATURES

- **Reads like the phone** — Bubbles, photos, voice notes, documents, date jumps
- **Search everything** — Across all chats, by text, sender, date, type, tag
- **Merge and compare** — Recovers deleted messages, flags edits
- **Integrity proof** — SHA-256 fingerprints and a chain of custody
- **Evidence outputs** — PDF transcript, annexure bundle, Section 63 draft
- **Access control** — Admin, Reviewer, Viewer roles with an audit log
- **Encrypted storage** — Browser, local folder or Google Drive / OneDrive
- **Practice tools** — Client and matter, stars, notes, ready citations
- **AI and agents** — Claude summary, filing agent, browser tasks

Try it: open `ChatVault.html` in Chrome or Edge, or double-click the ChatVault desktop icon.

Private by design: everything runs on the user's device. Nothing is uploaded.
